

# Objective of Security

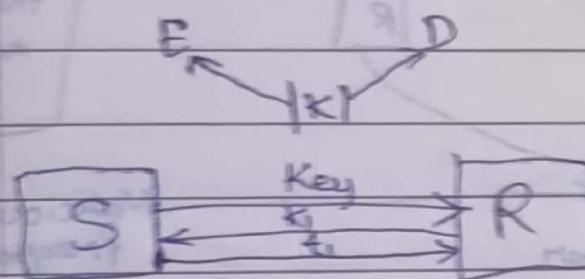

## Symmetric Cryptography

→ Same key for encryption & decryption

$G_x \rightarrow$  Credit Card no. (Plain Text)

$E(G_x) = t$  Encryption Alg.

$$E(G_x)_{K_1} = t_1$$

$$t_1 \text{ (Plain Text)}$$

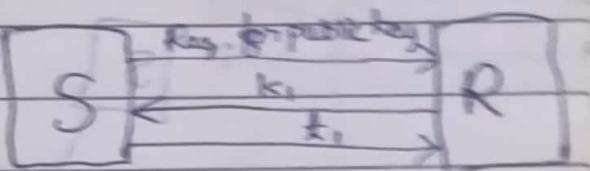

$$D(t_1)_{K_1} = G_x$$

## Asymmetric Cryptography

→ Different key for encryption & decryption.

Public Key —  $K_1$  (Encryption)

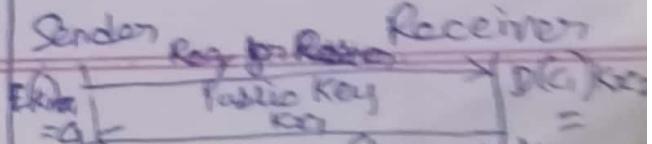

Private Key —  $K_2$  (Decryption)

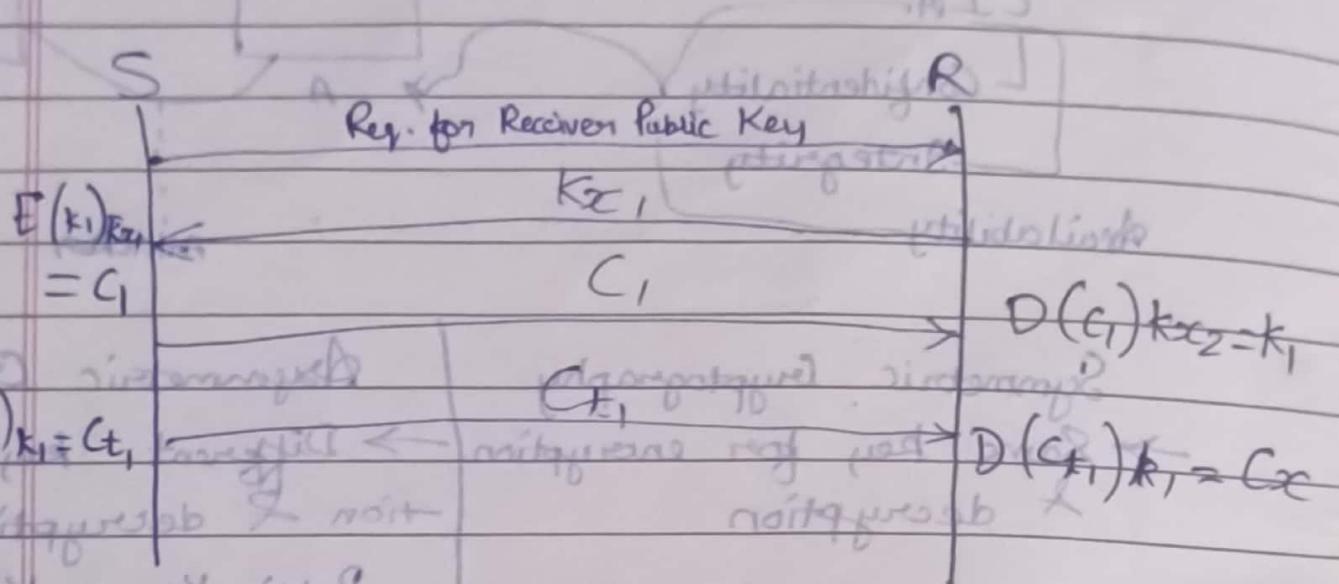

$$E(G_x)_{K_1} = t_1$$

$$D(t_1)_{K_2} = G_x$$

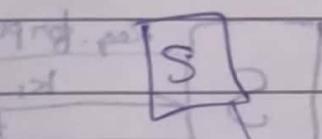

# Exchange  $K_1$  (Symmetric Key) in secured manner over communication channel.

Algo :  $K_{x_1} \rightarrow$  Public Key  
 $K_{x_2} \rightarrow$  Private Key

Integrity

$$t = h(P_1)$$

Credit Card no.

$$h(P_1) = dx$$

longer not required

$dx$

$R, D$   
Router

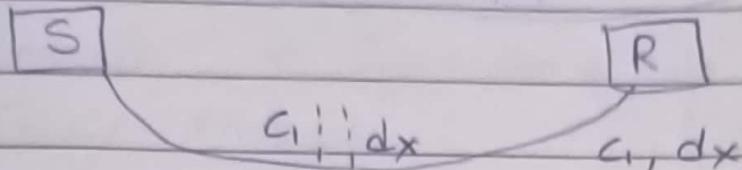

(not reqd.)  $t$

$x_2 = h(Alg)$

MD4, MD5, SHA1, SHA-256  
 SHA-512, SHA 3

128 bit

## \* Integrity corresponding Hashing Technique

Confidentiality: AES  $\rightarrow$  Encryption  
 Decryption  
 both

$$D(C_1) \xrightarrow{K_1} P_1$$

$$h(P_1) = dx_1$$

$$dx_1 - dx = 0$$

Hashing : MD5 / SHA 1, SHA 256

$E(P_1)_{K_1} = C_1 \rightarrow$  Encryption

$h(P_1) = dx \rightarrow$  Hashing Technique

If this happens,  
this means

no one has  
modified the message  
over the communication  
channel.

# Availability : Information should be available to  
legitimate user only.

Authentication : Process of verifying user credential at receiver's end.

\* Threats to Confidentiality

- Snooping — Interception of data from communication channel
- Traffic Analysis

\* Threats to Integrity

- Modification
- Masqueration
- Replay
- Repudiation

Design a cipher system "roll" to work b/w forward \*

S

R

$(S, T) = K$

$$R_1 = S \cdot T \cdot (T * T) \leftarrow$$

$$S = S \cdot T \cdot (P * T)$$

$T = P$  and  $P = Q$

\* Attacks on Unavailability

• Denial of Service (DoS)

$$S = S \cdot T \cdot (P * T)$$

$P = 0$

$$C_1 = (2B+2) \% 26 = 25 \quad \text{Text: } \underline{\underline{Z}} \quad (\text{X} * 9) \% 26$$

$$C_2 = (2E+2) \% 26 = 4 \quad \text{Text: } \underline{\underline{E}} \quad (\text{E} * 1) \% 26$$

$$C_3 = (2S+2) \% 26 = 125 \% 26 \quad (\text{B} * 11) \% 26$$

$$C_4 = (2S+2) \% 26 = 125 \% 26 \quad (\text{B} * 11) \% 26$$

$$C_5 = (2S+2) \% 26 = 225 \% 26 \quad (\text{W} * 11) \% 26$$

$$K = 01 = 2S \% (25+11) \quad 01 = 2S \% (11 * 11) \% 26$$

$$Z = 81 = \text{Cipher + Text} = zebbw \% 26 \% (11 * 11) \% 26$$

$$X = 01 = 2S \% (25+11) \quad 01 = 2S \% (11 * 11) \% 26$$

### Decryption

$$T = (25 - 2) \% 26 = 23 \text{ pad on next row}$$

$$(4 - 2) \% 26 = 24 \quad \text{Rule 1: } k \geq 1 \quad \text{①}$$

$$(1 - 2) \% 26 = 25 \quad \text{Rule 2: } k \geq 1 \quad \text{②}$$

$$(1 - 2) \% 26 = 25 \quad \text{Rule 3: } k \geq 0 \quad \text{③}$$

$$(22 - 2) \% 26 = 20$$

$$\varphi = (23 * 7^{-1}) \% 26$$

- Q. Using affine cipher tech., convert following text cipher text & vice-versa.

$$\text{P-Text} = \text{COLLEGE} \quad \text{KEY} = (17, 20)$$

$$C = 2 \quad E = 4$$

$$O = 14 \quad G = 6$$

$$L = 11 \quad E = 4$$

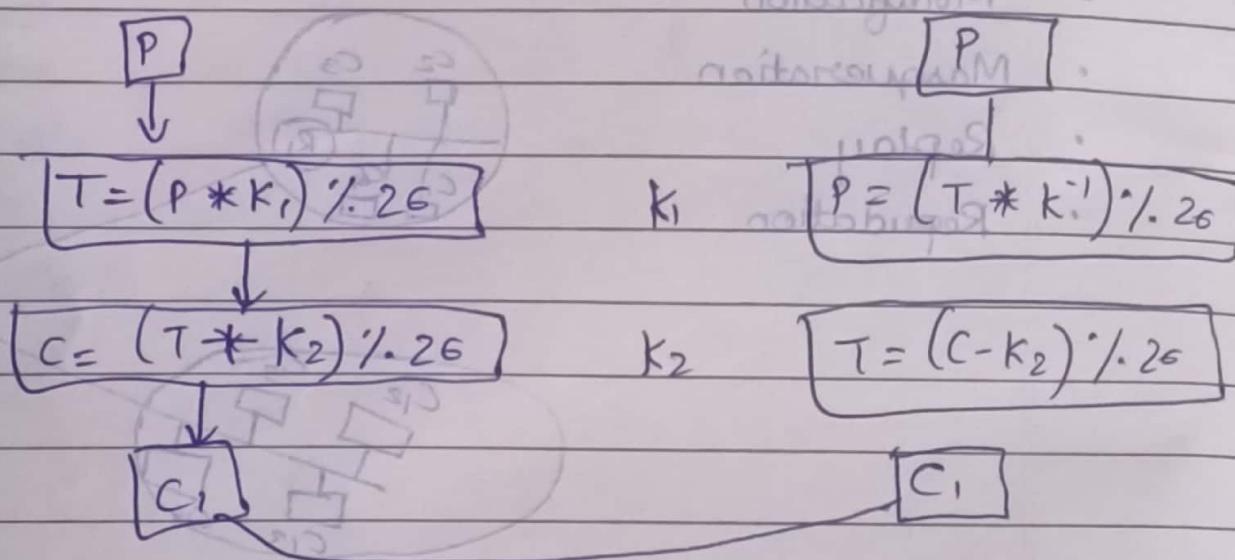

$$L = 11$$

\* Monoalphabetic Ciphers Technique

(a) Additive Cipher Tech

$$P \rightarrow T = (P + K) \% 26$$

\* Affine Cipher : Combo. of multiplicative & additive cipher

\* Encrypt and decrypt "Hello" using affine cipher

$$\text{Key} = (7, 2)$$

$$\text{Ans } h = 7 \rightarrow (7 * 7) \% 26 = 23$$

$$e = 4 \quad (7 * 4) \% 26 = 2$$

$$l = 11 \quad (7 * 11) \% 26 = 25$$

$$o = 14 \quad (2 * 14) \% 26 = 20$$

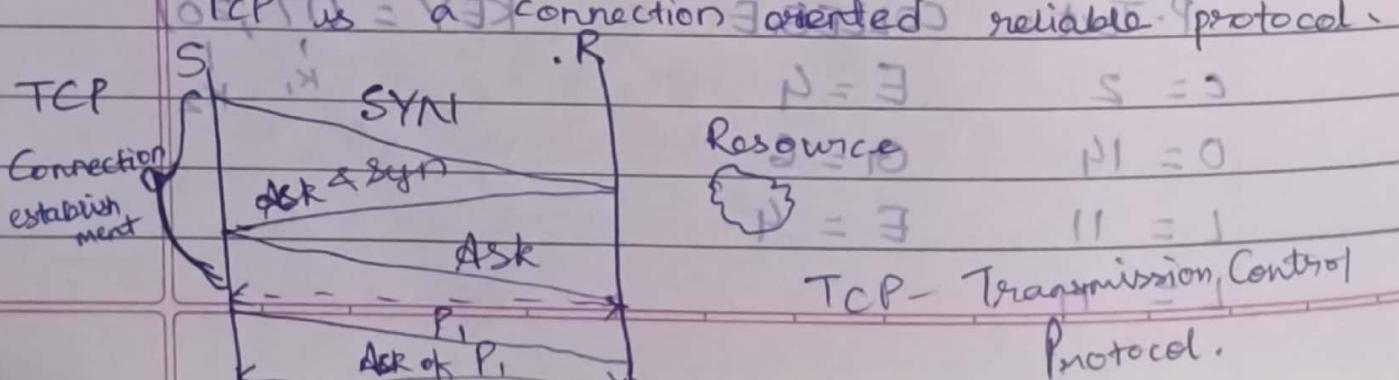

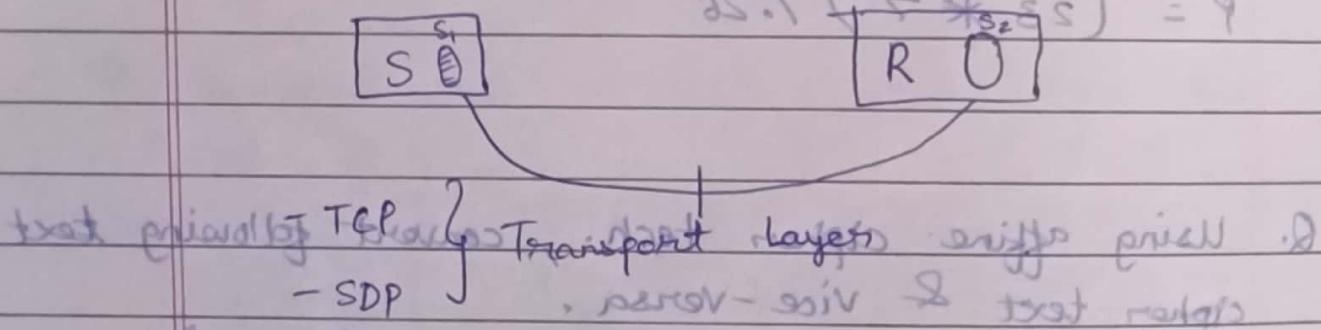

$$(2 * 14) \% 26 = 20$$

$$\begin{aligned}
 T &= (P * K_1) \% 26 = (B + Es) \% 26 = 10 \\
 &= (2 * 17) \% 26 = 88 \% 26 = 2 = C \\
 &= (14 * 17) \% 26 = 238 \% 26 = 24 = Y \\
 &= (11 * 17) \% 26 = 187 \% 26 = 25 = Z \\
 &= (11 * 17) \% 26 = 15 \% 26 = 25 = Z \\
 &= (4 * 17) \% 26 = 16 \% 26 = 10 = K \\
 &= (6 * 17) \% 26 = 12 \% 26 = 18 = S \\
 &= (4 * 17) \% 26 = 16 \% 26 = 10 = K
 \end{aligned}$$

\* When no key is given. Then find T

- ① Rule 1:  $\gcd(K_1, 26) = 1 \wedge (S - P) \neq 0 \pmod{26}$
- ② Rule 2:  $1 \leq K_1 \leq 25 = 05 \wedge (S - P) \neq 0 \pmod{26}$
- ③ Rule 3:  $0 \leq K_2 < 25 = 05 \wedge (S - P) \neq 0 \pmod{26}$

## Block Cipher

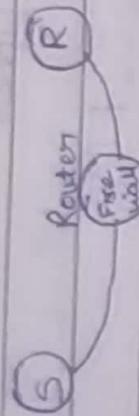

input text

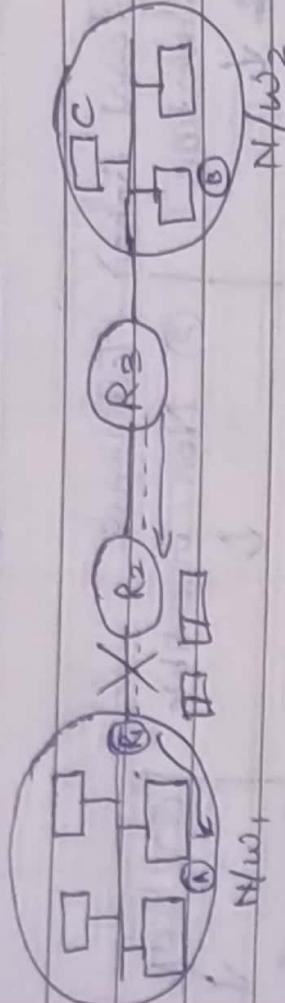

DES    ② AES    algos.

- Feistel Cipher Techniques uses X-OR operation.  
X-OR doesn't loose any information during encryption or decryption.
- It is reversible.
  - It induces a random noise in the algorithm.
  - X-OR function cancels the effect of encryption during decryption operation.
- Handwritten notes:

$$\begin{bmatrix} 02 & 03 \\ 01 & 02 \end{bmatrix} \text{ v} = \begin{bmatrix} b_1 \\ b_2 \end{bmatrix}$$

$$\begin{bmatrix} 01 & 02 & 03 \\ 01 & 02 & 03 \end{bmatrix} \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

### # Mix Column Operation

$$S = \begin{bmatrix} 63 & 47 \\ F2 & 9C \end{bmatrix}$$

$$S \cdot C = \begin{bmatrix} 02 & 03 \\ 01 & 02 \end{bmatrix}$$

$$b = \begin{bmatrix} b_0 & b_2 \\ b_1 & b_3 \end{bmatrix}$$

Always while multiplying, write constant mtr. first.

$$b_0 = \begin{bmatrix} 02 & 03 \\ 01 & 02 \end{bmatrix} * \begin{bmatrix} 63 \\ F2 \end{bmatrix} = (02 * 63) \oplus (03 * F2) \oplus (01 * 63) \oplus (02 * F2)$$

### Finite Field Arithmetic Operation

\* In advanced AES algo., multiplication of 2 hexadec value is performed by using Finite Field arithmetic operation i.e.  $GF(2^8) \rightarrow$  Galion field. This operation is supporting max. scrambling/shuffling of data.

$$b_0 = (02 * 63) \oplus (03 * F2)$$

$$02 = 00000d\ 0010\ 80\ 50\ 10\ 10$$

$$63 = 0110\ 0011\ 50\ 10\ 10\ 80$$

$$GF(2^8) = x^7 + x^6 + x^5 + x^4 + \dots + x^1 + 1$$

$$GF(2^8) = \{0000\ 0000(x), (x)\overline{0111\ 1111)\}$$

$$\{02\} = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1$$

$$0\ 0\ 0\ 0\ 0\ 10\ 1\ 0$$

$$= x \quad 10001001 \quad 10010001$$

$$\{63\} = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1$$

$$0\ 1\ 11011000\ 0\ 0\ 11$$

$$= x^6 + x^5 + x + 1 \quad (D)$$

$$D = (S7 * E0)$$

$$(02 \times 63)(S7 * E0) * (x^6 + x^5 + x + 1)$$

$$= x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1$$

$$= 110010110 \quad (C)$$

$$B = 110010110 \quad (C)$$

$$\{03\} = 0000 \oplus 0011 * -1 \quad (D)$$

$$\{F2\} = 1000 \quad 0011000 = x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1$$

$$(03 \times F2) = x^8 + x^7 + x^6 + x^5 + x^4 + x^3 + x^2 + x + 1$$

$$(S7 + 2x + 2x^2 + 2x^3 + 2x^4 + 2x^5 + 2x^6 + 2x^7 + 2x^8) = x^8 + (x^4 + x^3 + x^2 + x + 1) =$$

Degree of above polynomial is 8 which is not a part of GF. Maximum degree supported by GF(2<sup>8</sup>) is 7. Now, we need to convert above poly into reduced poly. For that divide, above poly by irreducible poly.  $P(x) = x^8 + x^4 + x^3 + x^2 + 1$

$$P(x) = 100011001$$

$$t(x) = G(x) / P(x)$$

$$= 100010110$$

⑦ Encryption

$$C = M^e \bmod n$$

⑧ Decryption

$$M = C^d \bmod n$$

$$00100110 =$$

$$110 =$$

## Diffie - Hellman Algo:

- ① Find primitive root of prime no.

$$P = 7 \quad (2, 3, 4, 5, 6)$$

$$2^1 \bmod 7 = 2$$

$$2^2 \bmod 7 = 4$$

$$2^3 \bmod 7 = 1$$

$$2^4 \bmod 7 = 2$$

$$2^5 \bmod 7 = 4$$

initialization part taken

$\therefore 2$  is not primitive root of 7

bcoz 2 is repeated.

$$3^1 \bmod 7 = 3$$

$$3^2 \bmod 7 = 2$$

$$3^3 \bmod 7 = 6$$

$$3^4 \bmod 7 = 4$$

$$3^5 \bmod 7 = 5$$

$$3^6 \bmod 7 = 1$$

$3 = 3$  is primitive root of 7

$$P = 11 \text{ bnm}$$

Sender  $11 \text{ bnm}$

Receiver

- ① Select primitive root  $P$

$\alpha \rightarrow$  Primitive root

$\alpha$  of  $P$  bnm

$P, \alpha$

- ② Find private key ( $x_A$ )  $\rightarrow$  Random value

- ③ Find out public key  
 $y_A = (\alpha)^{x_A} \bmod P$

$P, \alpha$

- ② Find out private key ( $x_B$ )

- ③ Find out public key  
 $y_B = (\alpha)^{x_B} \bmod P$

(4)

~~on using their private key -  $y_B$

$y_B \times P \mod P = 9$~~

(5) Secret key calculation

$$y_1 = (y_B)^{x_A} \mod P$$

Public key of  
receiver

(6) Secret key calculation

$$y_2 = (y_A)^{x_B} \mod P$$

$P = 11$   $\rightarrow$  Public key

$$y_1 = y_2 = 9 \mod 11$$

Eg.  $P = 11, \alpha = ?$ 

$$2^1 \mod 11 = 2$$

$$2^2 \mod 11 = 4$$

$$2^3 \mod 11 = 8$$

$$2^4 \mod 11 = 5$$

$$2^5 \mod 11 = 9$$

$$2^6 \mod 11 = 2$$

$$2^7 \mod 11 = 4$$

$$2^8 \mod 11 = 8$$

$$2^9 \mod 11 = 5$$

$$2^{10} \mod 11 = 9$$

$$2^{11} \mod 11 = 2$$

$$2^{12} \mod 11 = 4$$

$$2^{13} \mod 11 = 8$$

$$2^{14} \mod 11 = 5$$

$$2^{15} \mod 11 = 9$$

$$2^{16} \mod 11 = 2$$

$$2^{17} \mod 11 = 4$$

$$2^{18} \mod 11 = 8$$

$$2^{19} \mod 11 = 5$$

$$2^{20} \mod 11 = 9$$

## \* Man-in-the-Middle Attack

- During Key Exchange

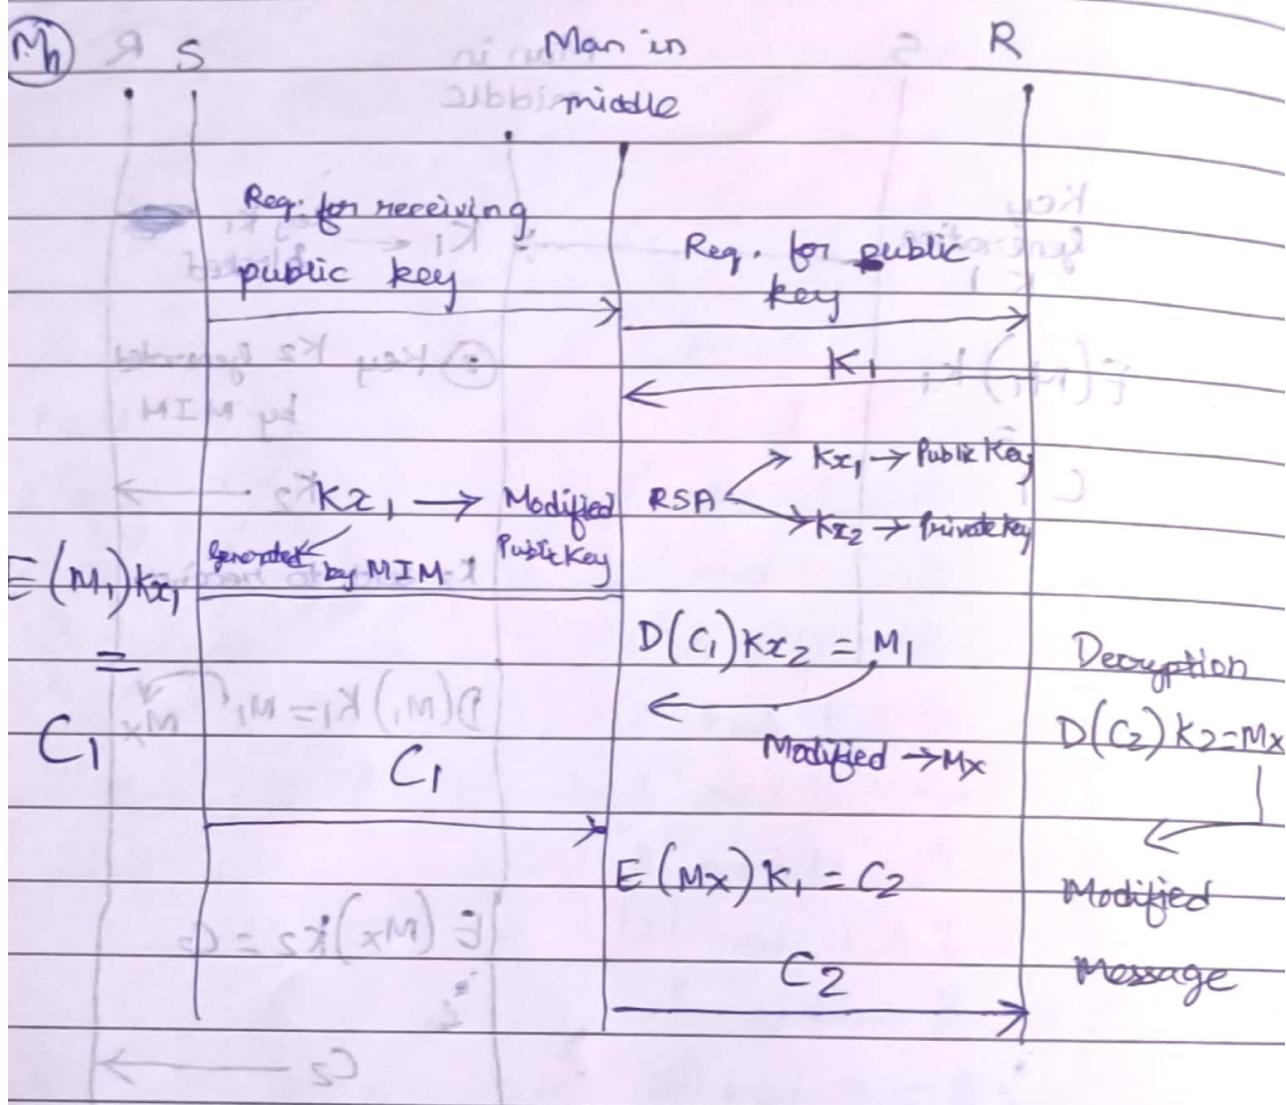

Man in middle attack on

① Symmetric Key Exchange Algo.

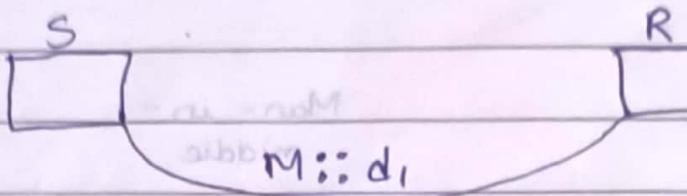

From step 2 to 10, m1 is substituted by s1 (modified). Initially, \*  
starts MIM process of egate transaction.

Man-in-middle attack in asymmetric key exchange  
 symmetric part attack -  
 or attack within in MIM  
 - job symmetric part symmetric ②

Digital Certificate and Authentication are the most important steps for countering MIM attack.

## \* Integrity of message - Hashing - ~~algorithm~~ \*

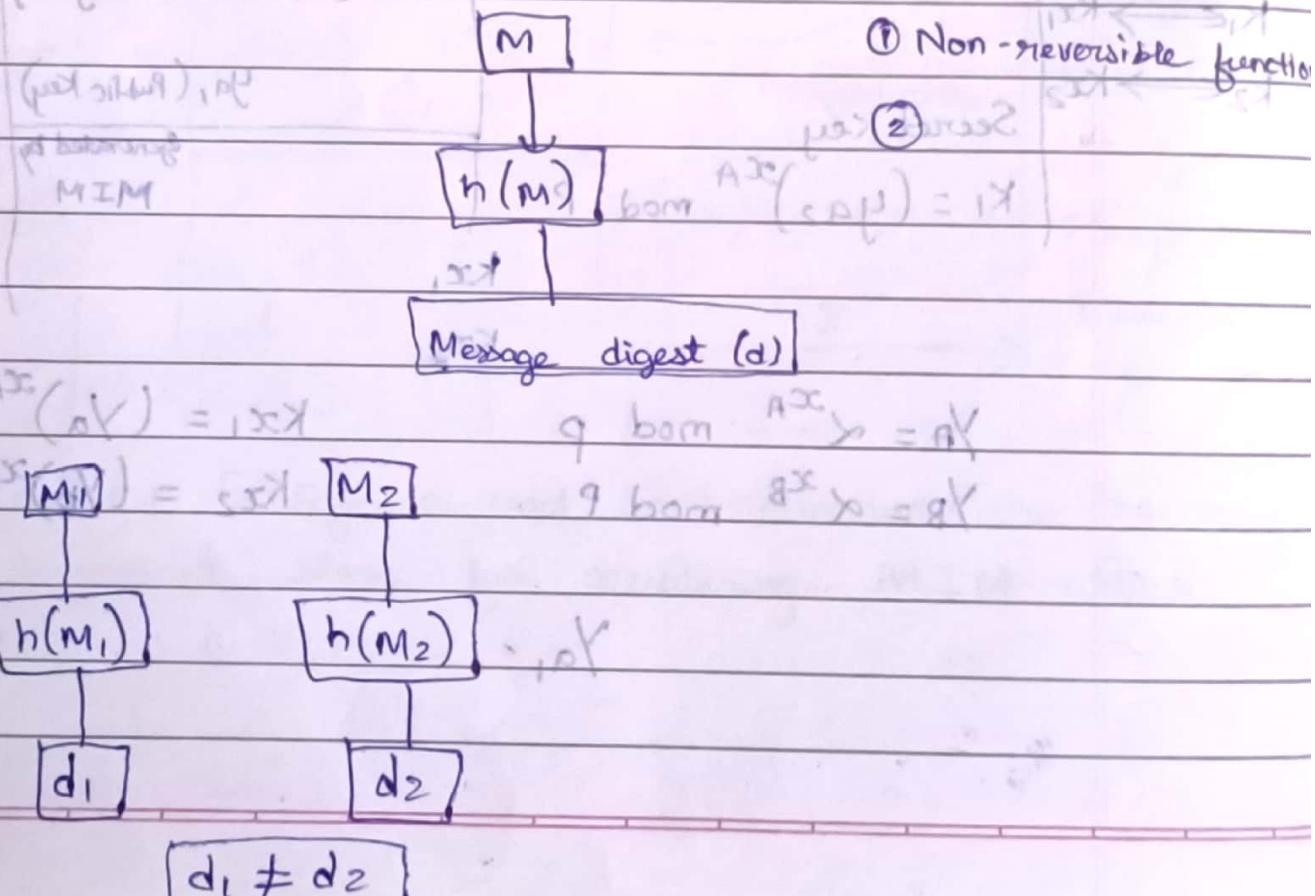

$$\textcircled{1} \quad h(M) = d_1 \quad (\text{Message digest})$$

$$h(M) = d_2$$

\textcircled{2}  $M \rightarrow \text{Message}$

$$d_2 - d_1 = 0$$

Various hashing techniques are used to check the integrity of the message. Below diagram, is represented how integrity of message is verified at receiving end.

NOTE: Reading detail hashing algorithm from Furozon or Atul Kahate.

### \* Message Digest (MD5)

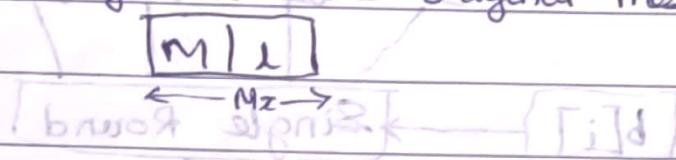

- Ron Rivest

MD, MD2, MD3, MD4, MD5

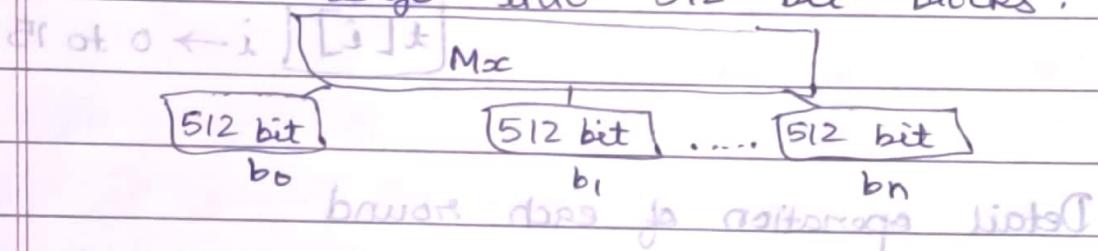

MD5 -> Algo based does go poss 2018

① Calculate the length of message ( $l$ ) .

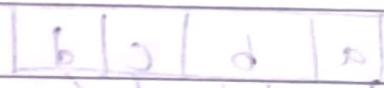

② Add  $l$  to the original message ( $M+l$ ) .

③ Divide message into 512 bit blocks .

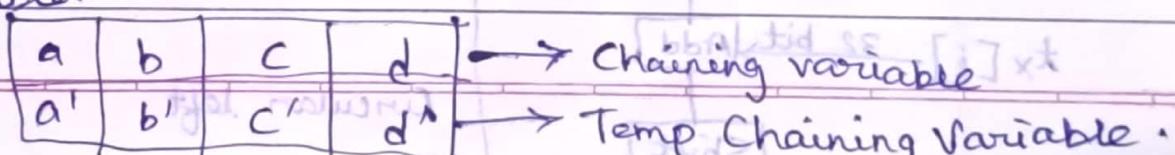

④ Padding

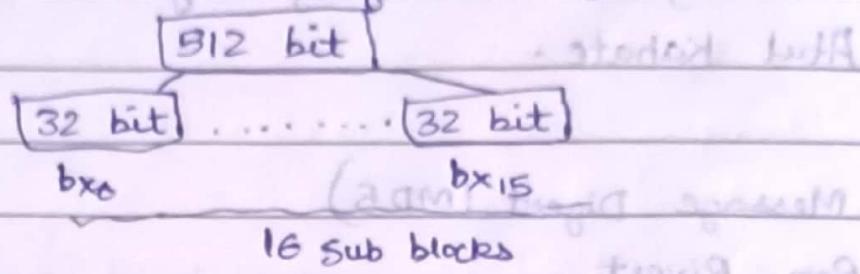

⑦ Divide 512 bit block into 16 sub block

⑤ Initialize chaining variable  $a, b, c, d$ . Size of each chaining variable is 32 bit .

⑥ Copy chaining variable into another temporary variable.

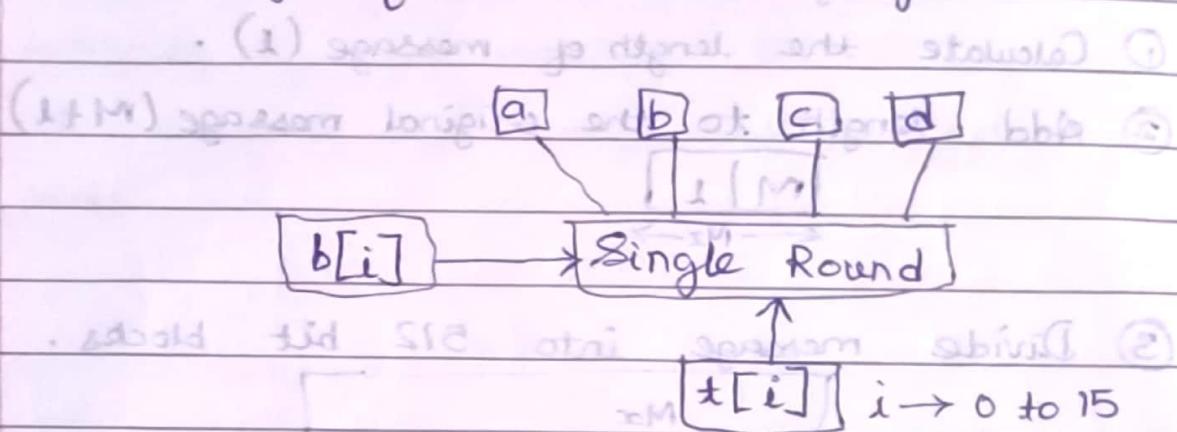

⑦ and each sub block of size 32 bit

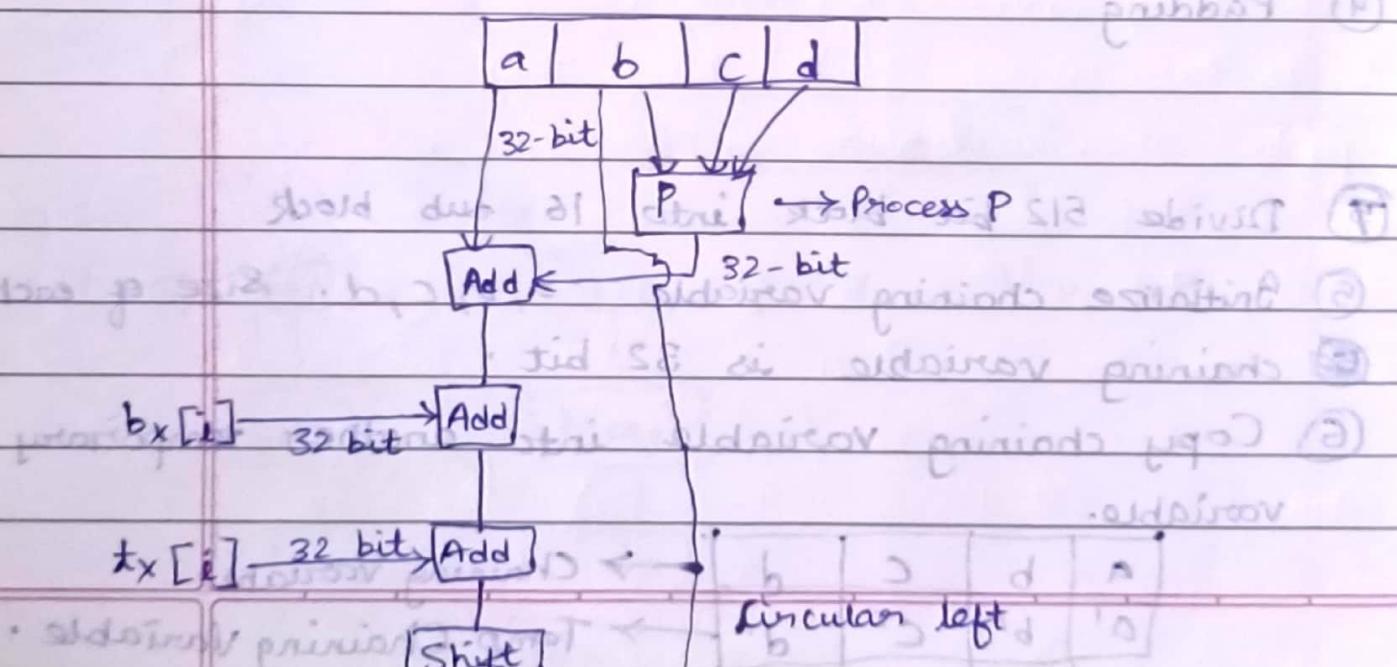

⑧ MD5 algo. is performing 4 rounds of operation

Block diag. of each round is given below.

Detail operation of each round

(After Shift)

Add

a'	b	c	d
----	---	---	---

\* Limitation by using add with some

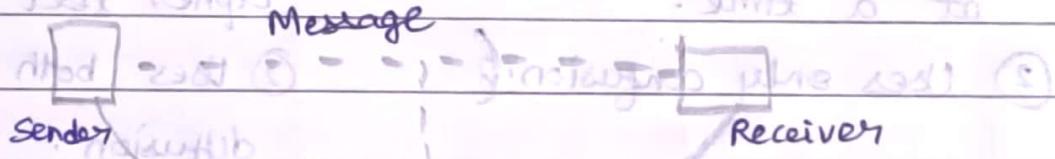

Only single variable gets modified in each cycle

way, receiver will calculate his public key  $y_b$  with help of his private key  $x_b$ .  
 $y_b = x^b \text{ mod } P$ . Then public keys are exchanged.  
An attacker can intercept these public keys and ~~that~~ manipulate them accordingly. This is not known to sender and receiver and they will continue to send messages to each other but it will be present to attacker, and the attacker will manipulate the messages and send to both.

This is how a MiM attack is carried out.

Digital certificates, digital signature and authentication are the steps that can be taken to enhance security against MiM attack.

\* Integrity of message sent from ~~any~~ sender to receiver through communication channel if not tampered or manipulated is called integrity.

Integrity attacks aim to alter or forge data to deceive the recipient into accepting invalid or incorrect information.

Few attacks on integrity are:

- (i) Modification attack: It is an attack in which unauthorized alteration of data is done.
- (ii) Replay attack: Replay attack takes place when an attacker captures previous sequences of events, data and uses them later on to produce an unauthorized effect.
- (iii) Masquerading: Pretending to be an authorized user to alter data.
- (iv) Repudiation: The sender or receiver can later deny to have sent or received the message.

### \* Stream Cipher Vs Block Ciphers

#### Stream

- ① Converts plain text to cipher text by taking 1 bit of plain text at a time.
- ② Uses only confusion.
- ③ Reversing the encrypted text is easy.
- ④ Complexity is hard.
- ⑤ Works on substitution technique like caeser.
- ⑥ Eg: ~~Caeser~~ Caeser Cipher, RC4.

#### Block

- ① Plain text is divided into blocks and is converted to cipher text.
- ② Uses both confusion and diffusion.
- ③ Reversing the encrypted text is hard.
- ④ Complexity is simple.
- ⑤ Works on transposition techniques like columnar.
- ⑥ Eg: DES, AES.

\* AES 128 : AES stands for Advanced Encryption Standard. It is a type of block cipher. AES 128 is where the key size is of 128 bits. For size of 128 bit of key, there are 10 rounds. The following structure represents the flow of AES 128-bit.

(a)  $KS = 128\text{-bit key size}$

(b)  $PS = \text{Input} + P \cdot F = \text{Intermediate}$

(c)  $PS = \text{Pre Round Transformation}$

(d)  $AI = PS \oplus \text{key} = \text{Final Output}$

Round 1  
 1. Substitute Byte  
 2. Shift Rows  
 3. Mix Column  
 4. Add round key

Round 2  
 1. Sub byte  
 2. Shift rows  
 3. Mix column  
 4. Add round key

Round 10  
 1. Sub byte  
 2. Shift rows  
 3. Add round key

128 bit

Explain all operations with example.

\* Affine Cipher :

Message = "djsc" key pair (7, 2)

$$\text{d} = 3, j = 9, s = 18, c = 2$$

$$\text{Encryption: } E = a \cdot x + b \% 26$$

$$E(d) = 7 \cdot 3 + 2 \% 26 = 23 \quad (x)$$

$$E(j) = 7 \cdot 9 + 2 \% 26 = 69 \quad (h)$$

$$E(s) = 7 \cdot 18 + 2 \% 26 = 24 \quad (y)$$

$$E(c) = 7 \cdot 2 + 2 \% 26 = 16 \quad (q)$$

\* Mix Column

$$\begin{array}{c|cc|c} 7B & 7C \\ \hline 76 & CA \end{array} \quad \text{Const. Mtx.} = \begin{bmatrix} 02 & 03 \\ 01 & 02 \end{bmatrix}$$

$$\text{Resultant Mtx.} = \begin{bmatrix} b_0 & b_2 \\ b_1 & b_3 \end{bmatrix}$$

$$b_0 = 7B \times 02 \oplus 7C \times 01$$

$$= 01110001 \times 000000010 \oplus 01110010 \times 00000001$$

$$= x^6 + x^5 + x^4 + 1 \times x \quad \oplus \quad x^6 + x^5 + x^4 + x \times 1$$

$$= x^7 + x^6 + x^5 + x \quad \oplus \quad x^6 + x^5 + x^4 + x$$

$$= x^7 + x^4$$

$$= 10010000$$

$$= 10010000$$

\* Attacks on RSA signed digest.

• Key only attack : Three ~~the~~ cases in this type

(i) Attacker intercepts the pair  $(S, M)$  [S : signature  
M : message] and tries to find another message  
 $M'$  that creates same digest,  $h(M) = h(M')$ .

Since hash algos are second preimage resistant,  
this attack is very difficult.

(ii) Attacker finds two messages such that  $h(M) = h(m)$   
Since hash algos are collision resistant, the attack  
is very difficult.

(iii) ~~Eve~~ <sup>Attacker</sup> may randomly find message digest D,  
which may match with a random signature S.  
Attacker then finds message m such that  $D = h(m)$   
Since hash function is preimage resistant, the attack  
is very difficult.

• Known - Message Attack : Eve has 2 signature-message  
pairs  $(m_1, s_1)$  and  $(m_2, s_2)$  which have been  
created using same private key. Eve calculate  
 $S \equiv S_1 \times S_2$ . If she can find a message M such that  
 $h(M) \equiv h(m_1) \times h(m_2)$ , a new message has been  
forged.

• Chosen - Message Attack : Eve can ask Alice to  
sign two legitimate messages  $M_1$  and  $M_2$ . Eve

then creates a new signature  $S = S_1 \times S_2$ . Since Eve can calculate  $h(M) = h(M_1) \times h(M_2)$  if she can find a message  $M$  given  $h(M)$ , the new message is a forgery.

**ECC Security and efficiency:** ECC is a simulation of El Gamal Cryptography. ① The security of ECC relies on solving the discrete logarithmic problem which is the difficulty of finding the integer  $k$  given points  $P$  and  $Q$  such that  $Q = kP$ .

ECC provides good security even with keys much smaller in size compared to RSA, leading to faster computations and reduced power consumptions.

ECC scales well with increasing key sizes, maintaining efficiency and security.

Operations involved in ECC are less computationally intense, making it suitable for devices with limited processing power.

**SHA-1:** SHA-1 is a modified version of MD5 and so it closely resembles the structure of MD5. SHA-1 works for any text whose length is less than  $2^{64}$ . The output message digest is of 160 bits. Operations involved in SHA-1 are:

PAGE NO.	
DATE	/ /

Padding: Like MD5, padding is the first step in SHA-2 too where padding is added to end of original message in such a way that length of message is 64 bit short of multiple of 512.

Append Length: Length of message excluding the length of padding is appended to the end of padding as a 64-bit block.

Message is then divided into blocks each of 512 bits in length.

Initialize chaining variables: 5 chaining variables A to E each of length 32 bits are initialized. Values of A-D are same as in MD5 but E is initialized to Hex C3 D2 E1 F0.

Process Blocks: Copy chaining variables A-E into variables a-e. Then divide the current 512-bit block into 16 sub-blocks, each containing 32 bit

length is 32 bit : L-AH2 : L-AH2 \*

all 32bit blocks fit in one RAM

so that we can draw L-AH2 . RAM is

in bytes all 32 bits not just in byte

and writing 32 bit value in memory
