Miniproject Abstract

Project Title: Music Recommendation System

Abstract:

Abstract for mini project:

With the vast amount of music available on digital platforms today, it can be challenging for users to discover new songs that match their personal tastes. A Music Recommender System leverages data such as user preferences, listening history, and metadata to provide personalized music recommendations. This project aims to develop a cloud-based music recommender system that utilizes the scalability, flexibility, and computational power of Cloud Computing to deliver real-time, accurate, and dynamic music suggestions. The system will incorporate machine learning algorithms such as collaborative filtering and content-based filtering, enabling it to analyze user behavior and recommend songs that align with individual preferences. Cloud technologies will be used to deploy the application, ensuring efficient data storage, seamless integration with multiple music streaming platforms, and enhanced security for user data. By utilizing Cloud, the system will benefit from advanced AI/ML tools, high-performance computing, and scalable infrastructure, allowing it to handle large datasets and provide reliable, real-time music recommendations. This cloud-based approach will not only optimize performance but also accommodate an ever-growing user base and music library. The proposed music recommender system will enhance user experience by providing personalized song suggestions while leveraging Cloud's infrastructure for reliability and efficiency.
